

Sprint 1: Retrospective report

Duration: 7 days

Goals:

1. Set up notion, github, jest, database
2. Implement user authentication, login and sign up functionality

What went well:

1. Authentication system was fully implemented
2. Github workflow was clean - good use of branches and meaningful pull requests from all team members
3. Peer reviews helped catch bugs before merging
4. Regular checkins to track progress
5. Team communicated well on whatsapp and notion comments where needed

What went wrong:

1. Lack of initial planning - backlog didn't break down user stories into smaller tasks
2. Story points not used - difficult to estimate progress and track workload
3. No testing strategy - tests were not implemented this sprint
4. Encountered blockers - blocked briefly on database configuration due to local environment differences

Actions for next sprint:

1. Break down stories into smaller tasks
2. Introduce burndown tracking and story points
3. Define and implement basic testing plan at the start of the sprint
